migration process Colab to Kaggle

What transfers vs. what needs redoing

Item	Transfers as is?	What to do on Kaggle
.ipynb file	Yes	Import the downloaded notebook
Python code	Yes	Nothing
Markdown cells	Yes	Nothing
Analysis and results	Mostly	Rerun to confirm they match
Package installs	No	Turn on internet, then run `%pip install ...`
File paths	No	Change `/content/` to `/kaggle/input/<dataset-name>/...` and remove `google.colab` / `drive.mount`
File storage	No	Upload the data as a Kaggle dataset
Account	No	Create or sign in to a Kaggle account

Steps

1. Open the finished notebook in Colab, save and rerun it as needed
2. Download the notebook and any data files referenced from Colab or Drive
3. Create a new notebook on Kaggle and import the downloaded notebook
4. Upload the data as a Kaggle dataset
5. Delete the `google.colab` import and `drive.mount` lines
6. Change `/content/` paths to `/kaggle/input/<dataset-name>/...`
7. Turn on internet in Kaggle. It is off by default.
8. Run `%pip install ...` for any missing packages
9. Run `import pandas as pd; print(pd.__version__)` and compare to the Colab version
10. Use Run All to confirm everything works, then export from Kaggle

one risk: package version drift

Colab and Kaggle both have separate preinstalled libraries. This means that the same notebook may run on different Python or library versions on each platform. When this happens results from the same notebook can change when it is moved and there will be no obvious warning. You can check the versions of things like pandas, numpy, and matplotlib to mitigate this.

a barrier I have hit moving local-to-Colab

It took me a moment to figure out that you need to upload the files to the session in Colab. I got used to uploading them to the same folder as my notebook and referencing them locally on Jupyter.
